

SO HOW DO I ACTUALLY GET MY AIX DATA INTO THE CLOUD?

Migrating your AIX and Unix workloads to Cloud but wondering how to physically get everything across?

Work with a migration expert

You probably only do this once - certainly for AIX workloads - choose AIX/Unix migration experts to support you

Dedicated connectivity from your cloud infrastructure provider or S2S VPN for smaller datasets

Connectivity is key

A plan for OS & a plan for data

How you should migrate OS data is generally different to migrating DB specific data

What is your migration window for each application or service. Can critical v non-critical services be identified?

Live v. Non-live migration

What if I have an absolute ton of data

Your cloud infrastructure provider such as Skytap on Azure, IBM PowerVS or L3C private cloud should have an appliance to help with this

L3C the Migration Experts

Fixed price migration to your chosen AIX/Unix cloud infrastructure provider
